- In section 3 we covered:

  1. section 3.1: Representation of data and functions pertinent to various FEM objects (*e.g.,* elements, nodes, and dofs).

  2. section 3.2: Steps needed from reading elements and nodes to FEM solution for node and element dof values and forces.

  3. section 3.3: Simplifications that can be employed in Matlab and description of input and output file formats.

- The term project involves:

  - Development of FEM solver for four different element types: 1. bars, 2. beams, 3. trusses, and 4. frames. The process to implement element specific routines (*e.g.,* stiffness and load vectors and well as output function) is described in course notes (section 3.3).

  - Limitations of implementation (*e.g.,* no source term and natural boundary force, same dof for all nodes, and some other are described in 3.3.

  - Input file format is provided in 3.3.

  - Beside solving the FEM problem (all steps in 3.2), the project involves Input/Output operation in accordance with the format given in section 3.3

- Deliverables are:

  1. **All Matlab or C++ files** should be submitted in a **zip file** with name "LastNameFEM-Project.zip".

  2. The **output file** corresponding to the truss problem shown in section 3.3. RunName = Truss. Input file is shown in that section and can also be downloaded from: http://rezaabedi.com/wp-content/uploads/2014/04/Truss.txt.

  3. From Reference [1]: **Input File** and **output File** for Figure 22.4 (also shown in figure **??**). RunName = TrussExt.

  4. From Reference [1]: **Input File** and **output File** for Exercise 22.3 (also shown in figure **??**). All geometry and material parameters are provided in the reference. RunName = FrameExt.

  5. From Reference [1]: Exercise 22.4 (A concept question about Exercise 22.3).
